[†] From least-squares fit to $E\gamma$ data up to 4886 keV. Above this energy level energies are from Table IV in 1998Ba80, but adjusted upward by 8.6 keV to consider updated $S(n)(^{50}\text{Ca})=6360.8$ 16 (2017Wa10), whereas 1998Ba80 used $S(n)=6352$ 10.

[†] All feedings are from the measurements ($\beta\gamma$ -coin and $n\beta$ -coin) by 1998Ba80. $I\beta$ to unbound states were normalized to $\beta^-n=29\%$ 3. $I\beta$ to the ground state is from the difference between the total β intensity and the measured β intensity to the excited states.

[‡] Absolute intensity per 100 decays.

 $\gamma(^{50}\text{Ca})$

I_γ normalization: Deduced by evaluators from equating measured $I\beta=3.7$ 4 (1998Ba80) to the first 2^+ state to net γ feeding of the first 2^+ state (100-summed γ intensity feeding the first 2^+ state).
